Image classification and intro to neural networks

Vlad Shakhuro

4 October 2023

Outline

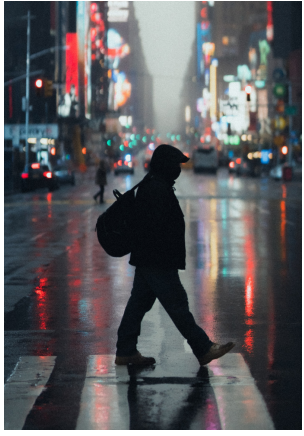
1. Image classification task and datasets

2. Linear classification and MLPs

3. Convolutional neural networks

4. Milestone: AlexNet

Binary classification



Does this image contain a pedestrian?

Binary answer $y \in \{ \underset{\text{no}}{0}, \underset{\text{yes}}{1} \}$

Alternatively, the estimated probability of the positive answer $p_{\text{yes}} \in [0;\ 1]$

Multiclass classification

Which object is shown on this image?

The set of *allowed* object classes is determined in advance

Integer answer $y \in \left\{ \underset{\text{car}}{1}, \underset{\text{sign}}{2}, \ldots, \underset{\text{bike}}{S} \right\}$

Alternatively, a list of estimated probabilities:

$$p_i \in [0;\ 1] \quad i \in 1, \ldots, S \quad \sum_{i=1}^{S} p_i = 1$$

Attribute recognition

Male
Asian
Bearded
Smiling

Attributes are properties or characteristics that are commonly expressed by some object

Human attributes may include race, sex, age, color of hair, current emotional state or the presence of wearable accessories such as masks, glasses and hats

Attribute recognition can often be reduced to one or more classification tasks, for example:

- *sex* → binary
- *race* → multiclass
- *age* → multiclass (over discrete age groups)

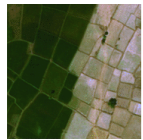
Metrics

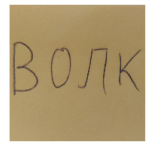
Accuracy — percentage of correctly classified samples

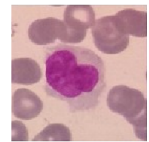
Dataset	CNN	Original	BP[23]	CBP[11]	KP	Others	
CUB [43]	VGG-16 [38]	73.1*	84.1	84.3	**86.2**	82.0	84.1
	ResNet-50 [15]	78.4	N/A	81.6	84.7	[18]	[16]
Stanford Car [19]	VGG-16	79.8*	91.3	91.2	**92.4**	**92.6**	82.7
	ResNet-50	84.7	N/A	88.6	91.1	[18]	[14]
Aircraft [27]	VGG-16	74.1*	84.1	84.1	**86.9**	80.7	
	ResNet-50	79.2	N/A	81.6	85.7	[14]	
Food-101 [4]	VGG-16	81.2	82.4	82.4	84.2	50.76	
	ResNet-50	82.1	N/A	83.2	**85.5**	[4]	

Top-K Accuracy (Rank K) — percentage of sample for which the correct class is within K most likely predicted classes (often K=5)

Data domains and modalities





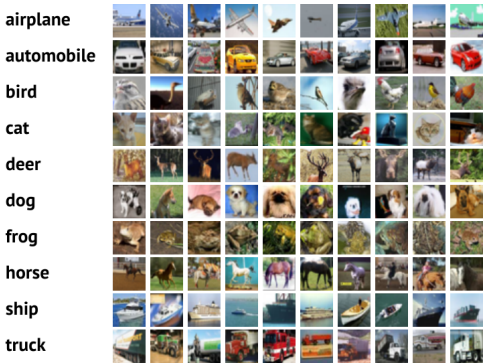


Every computer vision algorithm is designed to operate on images sampled from some *statistical population*. This population is described by an empirical distribution over the set of all "valid" (for that algorithm) images:

$$img \sim \mathrm{P}(\mathbb{I}) \qquad\qquad \mathbb{I} \subseteq \mathbb{R}^{\mathrm{H}\times\mathrm{W}\times\mathrm{C}}$$

These algorithms work by exploiting the inherent properties and invariants of the *statistical population* they support

CIFAR-10 and CIFAR-100



Subset of the TinyImages collection

60000 images total

CIFAR-10: 10 classes

- 5000 training images per class
- 1000 testing images per class

CIFAR-100: 100 classes

- 500 training images per class
- 100 testing images per class

Krizhevsky. Learning Multiple Layers of Features from Tiny Images. 2009

ImageNet

Goal: create a dataset with at least 1000 images for each of the original 117000 synsets/classes

~14 000 000 images (~1 000 000 images with bounding box annotations)
~22 000 non-empty classes (~**10 000 classes with at least 1000 examples**)

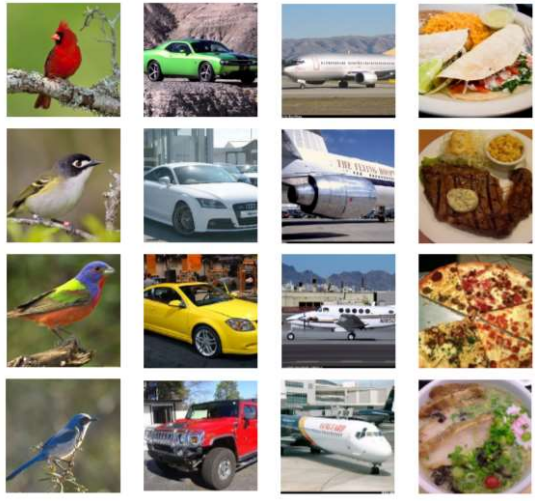
ImageNet: annotation problems

OpenImages

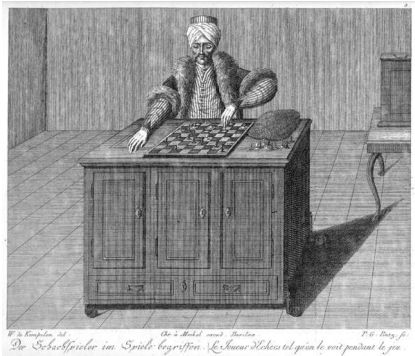
Goal: create the largest **open** dataset of real-life photograps with diverse annotations

- ~9 000 000 images
  licensed under CC BY 2.0
- ~60 000 000 annotations for ~20 000 categories
- Various supplementary annotations are also available (for example, localized text descriptions)

Fine-grained classification



Mechanical Turk



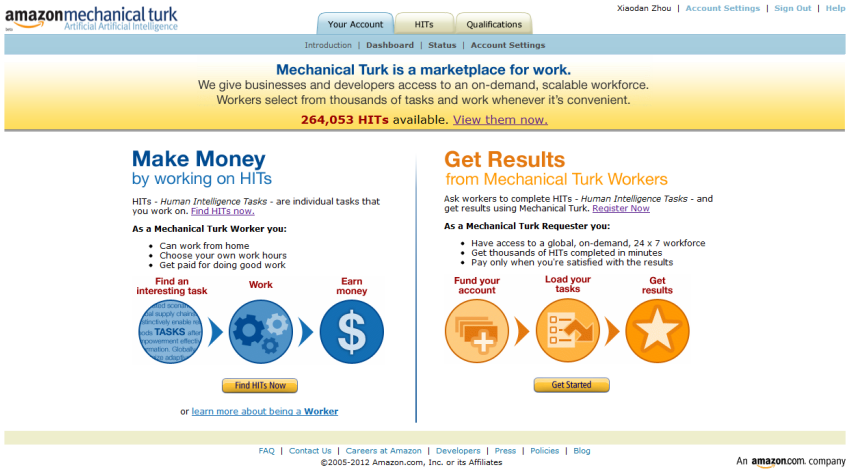
"Mechanical Turk, Automaton Chess Player" was a robot created **in 1770** that could play chess (and even beat competent players). In 1820 it was revealed that the robot couldn't actually play chess by itself and that it was instead **controlled by a human sitting in a hidden compartment**

Galaxy Zoo

GALAXY ZOO galaxyzoo.org

- Classification of galaxy images
- The first large scale project of this kind
- More than 150 000 volunteers created over 60 000 000 annotations in a single year **for free**

Annotation as a service



Outline

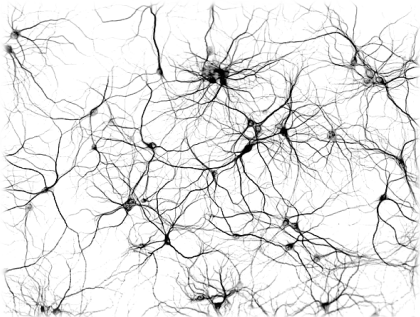
1. Image classification task and datasets

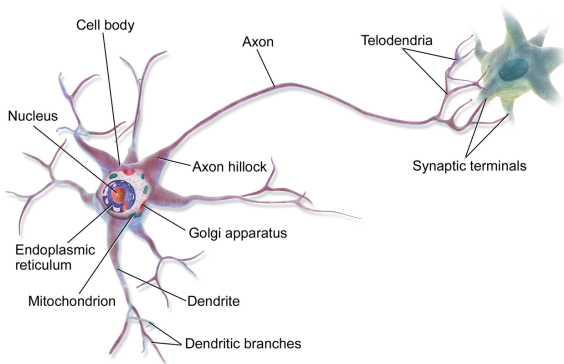
2. Linear classification and MLPs

3. Convolutional neural networks

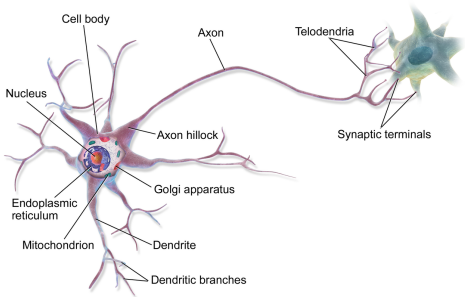
4. Milestone: AlexNet

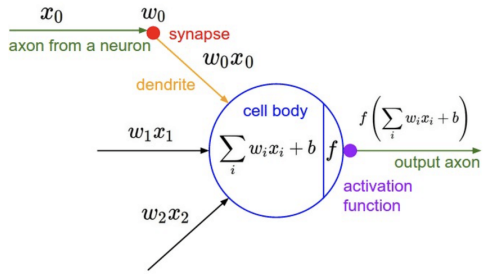
Biological neurons





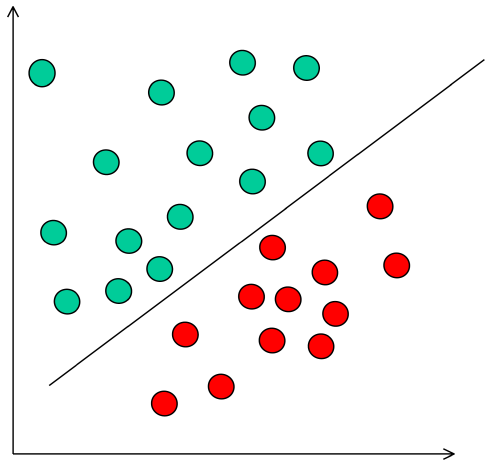
McCulloch-Pitts neuron model





$$a(x, w) = f\left(\sum_{i=1}^{n} w_i x_i + b\right)$$

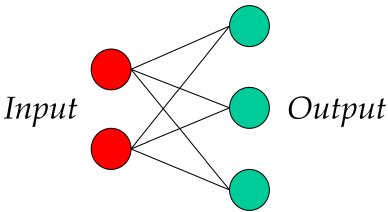
Neuron as linear classifier



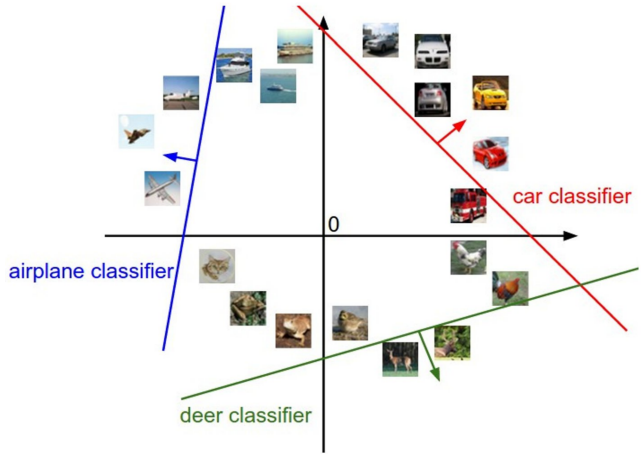
$$a(x, w) = f\left(\sum_{i=1}^{n} w_i x_i + b\right)$$

Optimal parameters w_i can be found using classical iterative methods

Multiclass classification

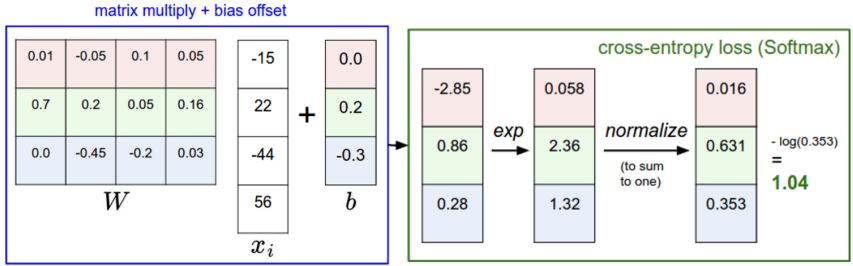


Perceptron



Multiclass classification for images

Loss function



Normalize scores with softmax activation:

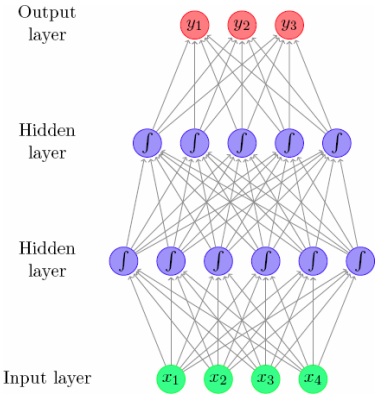
$$p_i^{\mathrm{pr}} = \frac{e^{y_i}}{\sum_{j=1}^{N} e^{y_j}}$$

and compute categorical cross-entropy:

$$L\left(p^{\mathrm{pr}}, p^{\mathrm{gt}}\right) = -\sum_{i=1}^{N} p_i^{\mathrm{gt}} \cdot \log\left(p_i^{\mathrm{pr}}\right)$$

Then we can train neuron using SGD with minibatches

Multilayer perceptron (MLP)



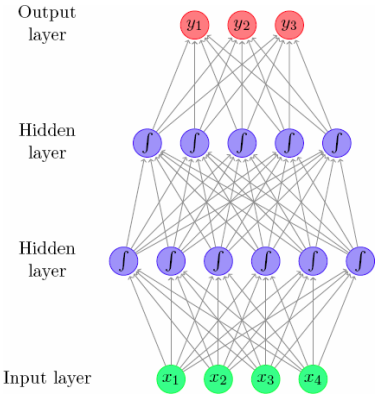
Chained perceptrons may be called **deep neural networks**

Layers in NN may have two meanings: a set of neuron activations (also called representations) and a set of connections with weights

Hidden layer neurons usually have nonlinear activation function (sigmoid, ReLU)

Number of outputs depends on task

Multilayer perceptron (MLP)



Chained perceptrons may be called **deep neural networks**

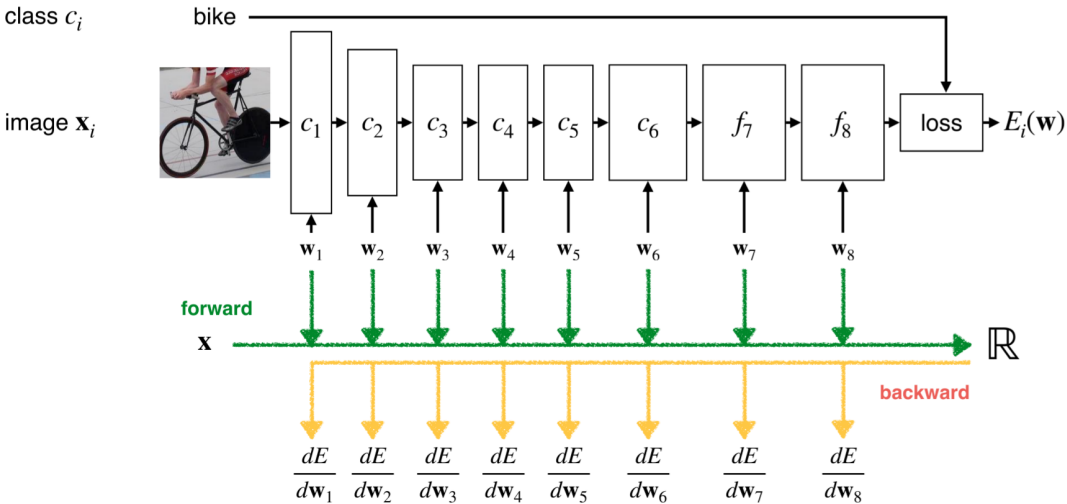
Layers in NN may have two meanings: a set of neuron activations (also called representations) and a set of connections with weights

Hidden layer neurons usually have nonlinear activation function (sigmoid, ReLU)

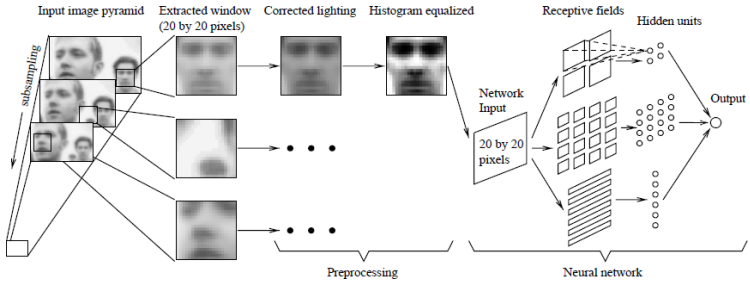
Number of outputs depends on task

How can we define architecture?

Backpropagation



Rowley face detctor



Rowley, Kanade. Neural Network-Based Face Detection. PAMI 1998

Outline

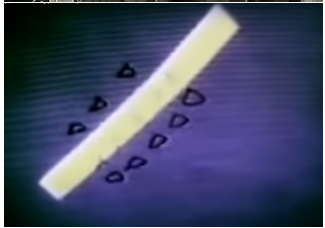
1. Image classification task and datasets

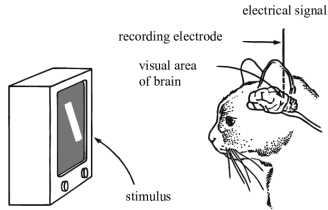
2. Linear classification and MLPs

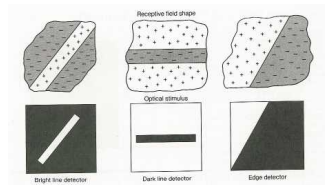
3. Convolutional neural networks

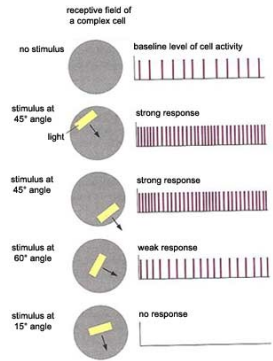
4. Milestone: AlexNet

Hubel and Wiesel visual cortex experiments

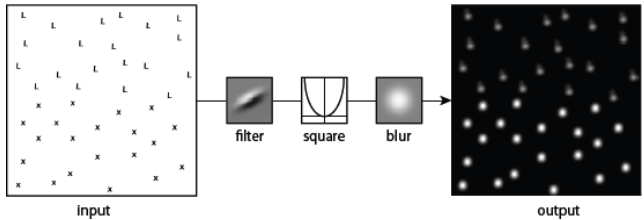








Modelling texture



Texture may be described using a bank of filters. Every pixel convolved with filters will give vector of features

Gabor filter as a model for simple cells

Bank of filters may be obtained using gabor filters for different orientations:

$$g(x, y; \lambda, \theta, \psi, \sigma, \gamma) = \exp\left(-\frac{x'^2 + \gamma^2 y'^2}{2\sigma^2}\right) \cos\left(2\pi \frac{x'}{\lambda} + \psi\right)$$

$$x' = x \cos\theta + y \sin\theta$$

$$y' = -x \sin\theta + y \cos\theta$$

Parameters:

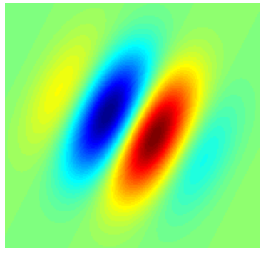
σ — gaussian stdev

γ — aspect ratio

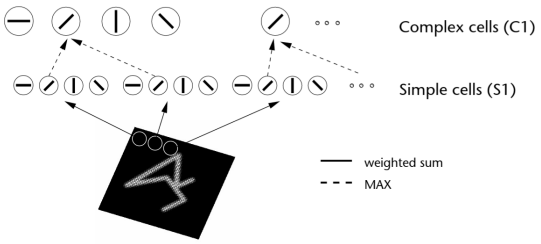
θ — orientation

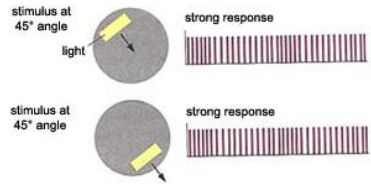
λ — wave length

ψ — phase shift



Max operation as a model for complex cells

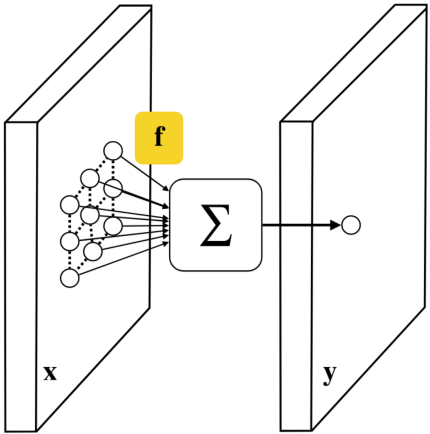




Position invariance (complex cells) may be obtained using MAX operation on top of simple convolutional cells

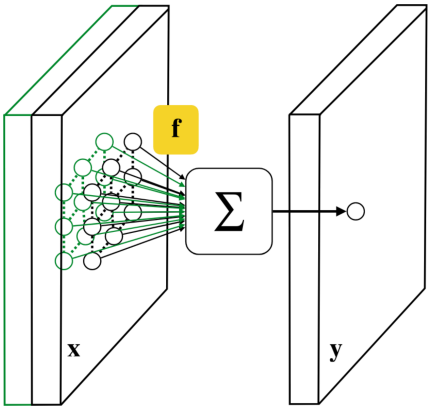
Riesenhuber, Poggio. Hierarchical models of object recognition in cortex. Nature neuroscience 1999

Convolutional layer



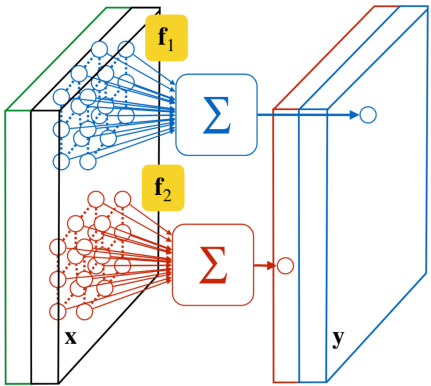
Convolution (linear filtering) for whole image may be modelled using a layer of neurons with shared weights.

Convolutional layer



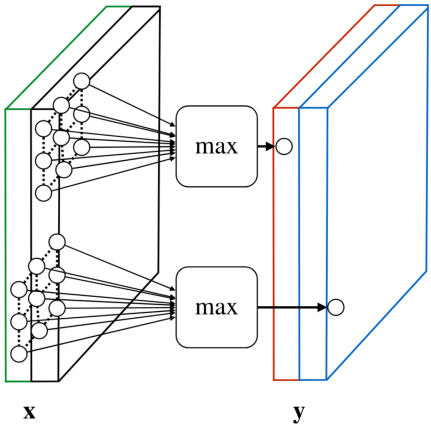
Convolution (linear filtering) for whole image may be modelled using a layer of neurons with shared weights.

Convolutional layer

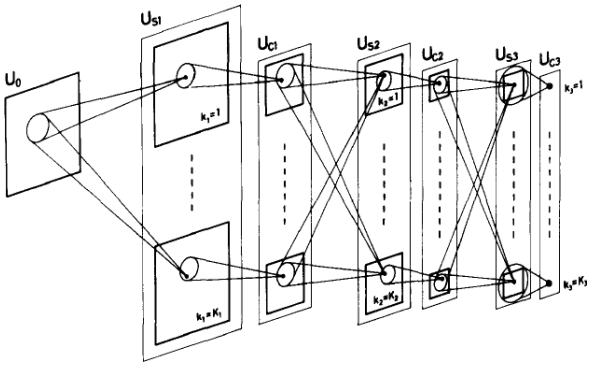


Convolution (linear filtering) for whole image may be modelled using a layer of neurons with shared weights. Convolutional layer is a set of convolutions over the same input

Max pooling layer



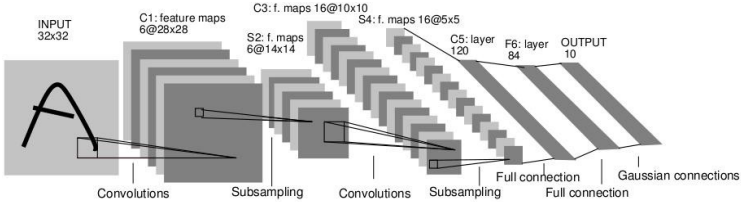
Neocognitron



Multilayer network with interleaved S and C layers. Last layer neurons are invariant to shifts in image

Fukushima. Neocognitron: A self-organizing neural network model for a mechanism of pattern recognition unaffected by shift in position. Biological Cybernetics 1980

LeNet

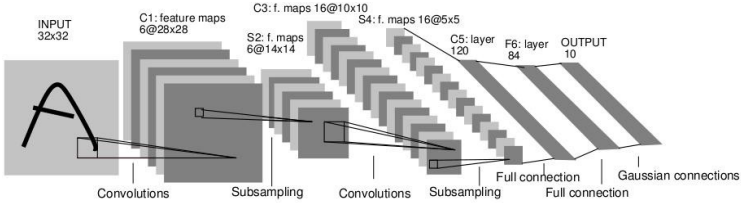


Neocognitron idea + error backpropagation method
→ Convolutional Neural Network (CNN)

Since convolutional neurons share parameters and look at a small neighbourhood, convolutional networks are very effective

LeCun et al. Gradient-based learning applied to document recognition. 1998

LeNet



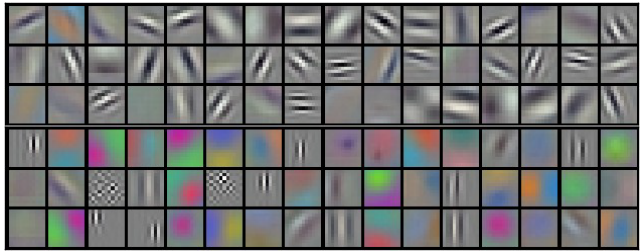
Neocognitron idea + error backpropagation method
→ Convolutional Neural Network (CNN)

Since convolutional neurons share parameters and look at a small neighbourhood, convolutional networks are very effective

How may trained weights are there in different layers? (C1, S2, …, F6, Output)?

LeCun et al. Gradient-based learning applied to document recognition. 1998

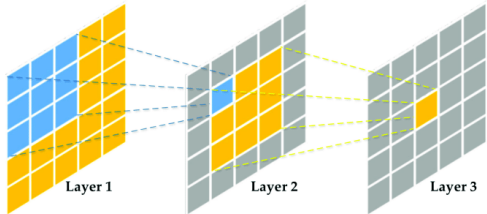
Convolutional filters for RGB images



Neural networks trained on RGB image classification task have first layers very similar to Gabor filter

Some layers may duplicate each other

Receptive field



Receptive field is an area of image that *may* influence neuron output. Depends on network architecture

Effective receptive field is an area that depends on trained weights

Outline

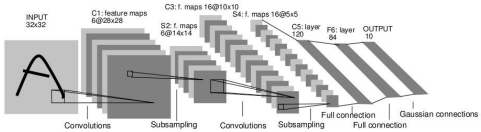
1. Image classification task and datasets

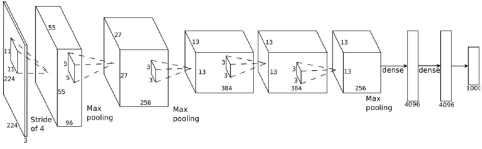
2. Linear classification and MLPs

3. Convolutional neural networks

4. Milestone: AlexNet

LeNet and AlexNet comparison





1998:

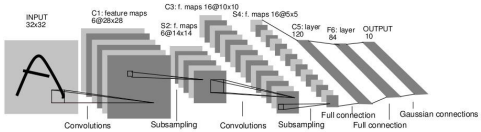
- 2 conv layers (6, 16 filters)
- 2 fully connected layers (120, 84 neurons)

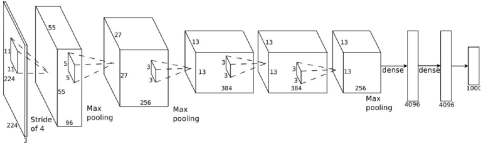
2012:

- 5 conv layers (96, 256, 384, 384, 256 filters)
- 2 fully connected layers (4096, 4096 neurons)

Krizhevsky A., Sutskever I., Hinton G. E. Imagenet classification with deep convolutional neural networks. NIPS 2012

LeNet and AlexNet comparison





1998:

- 2 conv layers (6, 16 filters)
- 2 fully connected layers (120, 84 neurons)

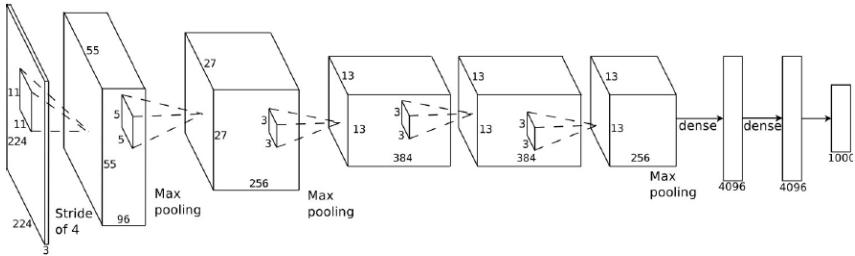
2012:

- 5 conv layers (96, 256, 384, 384, 256 filters)
- 2 fully connected layers (4096, 4096 neurons)

What else has changed?

Krizhevsky A., Sutskever I., Hinton G. E. Imagenet classification with deep convolutional neural networks. NIPS 2012

AlexNet

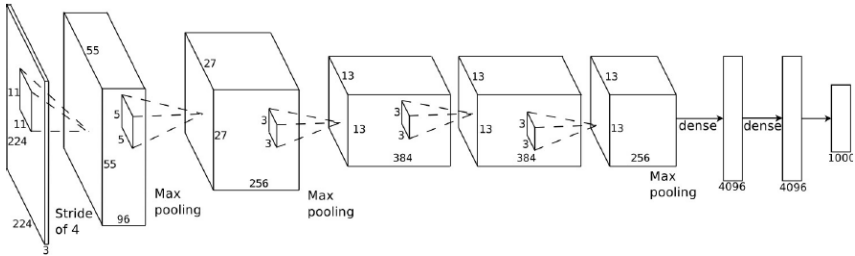


- 60M parameters
- 2GPU × 3GB, 5GB RAM, 27GB HDD
- 1 week to train

Key ideas:

- ReLU activation
- image augmentations
- dropout

AlexNet



- 60M parameters
- 2GPU × 3GB, 5GB RAM, 27GB HDD
- 1 week to train

Key ideas:

- ReLU activation
- image augmentations
- dropout

HW: compute *manually* number of parameters for AlexNet

Conclusion

We reviewed following topics:

- image classification tasks
- how to obtain and label data
- classification with single neuron and MLP
- main biological principles behind convolutional neural networks
